brief (it took me a total of maybe 40 minutes max, most likely because I spent more time frustrated about the grammatical errors, looking for some type of scientific reference, and being appalled at the brevity and superficial statements, which were being repeated over and over again). I'm sure this was a labor of love for the author, but not very helpful for someone who actually wants to start a worm farm, like myself. There are much better resources online than in this "pamphlet". There's a total of 41 unnumbered pages, with a total of 3 black and white photos, which were not even relevant to the content. Your \$10 would be better spent as worm bedding. 1 of 1 people found the following review helpful. Good Job Guys! By Velociryx This is one of those topics that even people who are into sustainability may shy away from because of the "ick factor." They shouldn't. As this guide makes clear, vermiculture is actually a lot less "icky" than you'd imagine if you've never done it. There was a fantastic project started some years ago called "The Greening of the Desert" which was all about finding ways of reclaiming deserts and rebuilding the soil there. Soil "critters" as this book calls them (good term!) play a pivotal role in that, and the results of the Greening of the Desert project have been astonishing. They were able to turn desert sand into fertile, productive soil in under two years. Since most people reading this book probably don't live in a desert, imagine how big of an impact small scale, at-home vermiculture can have on the soil quality in your backyard garden or greenhouse! Great introduction to the subject, and people new to the topic will love the fact that the guide goes into some detail about how to build worm farms out of a variety of materials - you can literally construct one using scrap materials or free stuff you can find on Craigs List, making it one of the easiest and cheapest ways to get into sustainability. 0 of 0 people found the following review helpful.
