Comments on "Your Log House" by Vic Janzen By Cihat Aytac I consider this book has a very clear and easy language also helping people unexperienced in the process of building a log house. It provides very useful information even for the beginners to construct main elements of their log house such as footings, walls, windows, doors, roof, joists, framewalls and others. The drawings and pictures are excellent providing guidance during the construction process. In some pages, construction process is detailed on a

sample plan for proper interpretation of the complete process by the builder. Additionally, some useful floor plans are also briefly introduced, but complete construction plans are available from the writer upon request with payment of corresponding price.

This is not a manual that can be read as book, put on the shelf and the building started. It is an on-site reference work intended to be open on the job. The book is written in a cumulative style. That is, it is necessary to start at the beginning and gain knowledge as the book and the building project progresses. For anyone with a dream to build a log house or have one built professionally, it is a must. It serves to instruct, inspire and make the reader knowledgeable about log construction at every level. For the professional builder or proprietor who already knows most of what this book teaches, the book would be useful for apprentices and other newcomers to the craft. It would also serve well to pass on to prospective customers to both inspire them further and to bring them up to speed on the language and concepts of log building.
